

Protection inside and outside the office: the new state of cybersecurity

More and more employees are working outside of the central office - and often outside of its protection. To secure these remote workers and locations requires a fundamentally different approach.

A recent survey of 450 cybersecurity experts by the Enterprise Strategy Group explored the many facets of protecting a network without perimeters.

The workforce has never been more distributed - **or more at risk.**

40%

of today's workers are roaming users.

88%

of organisations have 5+ remote offices.

78%

believe roaming or remote users are most vulnerable to attack.

66%

of respondents have experienced a targeted attack - the majority of these respondents report roaming and remote users have been compromised.

Most organisations are still using traditional methods to protect roaming and branch users - **but they just can't keep up with today's needs and expectations.**

82%

have a VPN policy but...

85%

believe roaming users violate that policy.

60%+

report all/most proxied roaming and remote traffic goes through the corporate network - but backhauling is expensive and slows performance for users.

To help drive better remote performance, SaaS and Direct Internet Access adoption are on the rise - **and so are security concerns.**

60%

expect that the majority of their organisation's apps will be SaaS - based within 2 years

41%

worry about data breaches in shadow IT SaaS apps - which are introduced without IT oversight.

Increasingly, organisations are introducing DIA to satellite offices - **and IT teams are struggling to secure these solutions without sacrificing performance.**

79%

of organisations making the shift to DIA.

Cisco Secure can help.

More and more organisations are looking for a different solution - cloud - deployed and consolidated.

Today's users work everywhere, which means you need to protect them everywhere.

Cisco Umbrella is a cloud-delivered secure internet gateway (SIG) that provides the first line of defence against threats on the internet. Because Umbrella is deployed from the cloud, it's the easiest way to protect all of your users - both on and off the corporate network.
